

CARBO-ECO pH

EC-FERTILIZER
MANGANESE FERTILIZER LIQUID

pH regulator for application broth.

The active ingredients of the product:

20 % carboxylic acids

pH 1,82

The product contains 3% manganese.

When treating crops against pathogens, pesticide use requires that the pH of the application broth does not reach basic values, to avoid the alkaline hydrolysis of the active substance. That is why using CARBO-ECO pH enhances pesticides activity.

CARBO-ECO pH is a pH-neutralizer for foliar solutions, that avoids the use of inorganic acids. The product contains carboxylic acids which exist in a natural way in plants (e. g. formic, tartaric or citric acid).

Recommendations for use:

General:

As a general rule it's enough to add 50 ml CARBO-ECO pH to 100 l of application broth. Dependant to the pH of the water used, the application rate can be increased up to 100 ml/100 l application broth.

Add CARBO-ECO pH as final component to the application broth and check pH.

Directions:

Miscibility:

CARBO-ECO pH can be mixed with usual plant protection products. However, since it is not possible to foresee any or all instances that may occur in practice it is in any case recommended to perform a trial first and apply the mixture to a small quantity of products intended to be treated.

Pack sizes:

20 l • 200 l • 1000 l

More pack sizes upon request.

Storage:

In a closed container, protected from sun light, not below 0°C.
